HITACHI Inspire the Next

VARIABLE FREQUENCY DRIVE LOOD Series

for Fan and Pump Applications

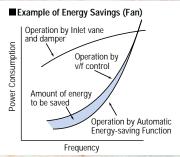

Hitachi's L300P Series Variable Fre Increased Energy Savings for Your

WIDE RANGE OF APPLICATION SPECIFIC FUNCTIONS

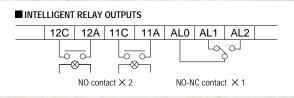

•AUTOMATIC ENERGY-SAVING FUNCTION

With its Automatic Energy-saving Function, the L300P delivers "real-time" energy-saving operation for your fan and pump applications. The function insures that motor operates at minimum current in response to the torque required by the load.

•ENHANCED INPUT/OUTPUT TERMINALS

Three relay output terminals are provided as standard for flexible interface to external control systems.

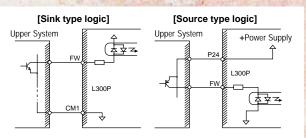

ANALOG OUTPUT MONITOR

In addition to PWM monitor(FM), programmable analog output monitors are also available for both voltage(0–10VDC) and current(4–20mA) at AM and AMI terminals of the L300P.

•INTELLIGENT INPUT/OUTPUT TERMINAL SYSTEM

The L300P features an intelligent control terminal system, which allows necessary drive I/O functions to be freely programmed. Input terminals can be selected for either sink or source type logic.

• EASY-TO-USE OPERATOR PANEL

L300P's digital operator panel supports various monitoring functions.

- Output frequency
- Output current
- Rotation direction
- Process variable, PID feedback
- Intelligent input terminal status
- Intelligent output terminal status
- Scaled output frequency
- Output voltage
- Power
- Cumulative RUN time
- Cumulative power-on time
- Trip event
- Trip history
- Warning code

quency Drive Delivers Fan and Pump Applications!

Hitachi variable frequency drives (inverters) in this brochure are produced at the factory registered under the ISO 14001 standard for environmental management system and the ISO 9001 standard for inverter quality management system.

EASE OF MAINTENANCE

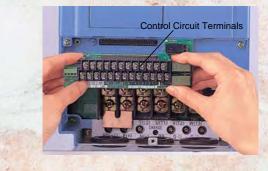

•EASY-REMOVABLE COOLING FAN AND DC BUS CAPACITOR

Cooling fan(s) and DC bus capaci-tors can be easily changed in the field. A fan ON/OFF function can be activated to provide longer cooling fan life.

•REMOVABLE CONTROL CIRCUIT TERMINALS

Eliminates control rewiring when field replacing the L300P.

COMPACT DESIGN

The L300P's compact size helps economize panel space. Installation area is reduced by approximately 30% from that of our previous series. (Comparison of 11kW (15HP))

USER-FRIENDLY OPERATION

•EASE OF OPERATION WITH DIGITAL OPERATOR (OPE-SR)

Output frequency can be controlled by the integral potentiometer provided as standard on the OPE-SR. The OPE-SR can be removed for remote control, and has an easy-to-see 4-digit display and LEDs to indicate the unit being monitored (i.e. frequency, amps, power, etc.). A multilingual operator (English, French, German, Italian, Spanish, and Portuguese) with copy function (SRW-0EX) and a digital operator without potentiometer (OPE-S) are also available as options.

•USER SELECTION OF COMMAND FUNCTIONS ("Quick Menu")

You can select frequently used commands and store them for fast reference.

•BUILT-IN RS485

RS485 is provided as standard for ASCII serial communication.

•PROGRAMMING SOFTWARE

Optional PC drive configuration software which runs on Windows[®] Operating System.

ENVIRONMENTAL FRIENDLINESS

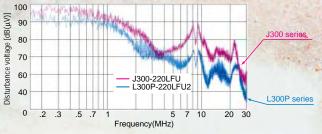

•*EMI* FILTER

EMI filters to meet European EMC (EN61800-3, EN55011) and low-voltage directive (EN50178) are available for system conformance.

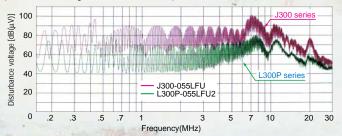

REDUCED NOISE FROM MAIN **CIRCUIT POWER SUPPLY AND CONTROL CIRCUIT POWER SUPPLY**

Disturbance voltage of the main circuit power supply and of the control circuit power supply has been improved by approximately 15dB(µV) and 20dB(µV) respectively compared to our previous model(J300), resulting in significant reductions to noise interference with sensors and other peripheral devices.

- Disturbance voltage of the main circuit power supply
- (It does not comply with European EMC directive. To meet the EMC directive, please use an EMI filter.)

 Disturbance voltage of the control circuit power supply (Disturbance voltage of terminal L or CM1)

HARMONICS MITIGATION

Terminals for the connection of a DC Reactor are provided as standard for harmonics suppression.

CONTROL OF VOLTAGE OF MICRO SERGE

Suppressing the motor terminal voltage less than 2xE[V]by improving the control method of PWM output. Input voltage: 400VAC (In the case) Motor terminal voltage:1,131V(400V× 2×2)

IMPROVEMENT OF ENVIRONMENT

The printed circuit board inside an inverter is varnish coating specification as standard.

PROTECTION FOR VARIOUS

Standard enclosure protection for the L300P is IP20 (NEMA1*). For IP54 (NEMA12), please contact Hitachi sales office.

*NEMA 1 applies up to 30kW. An optional wire-entry conduit box is required for 37kW to 75kW models to meet NEMA 1 rating.

PEREORN GINRAI

CONFORMITY TO GLOBAL STANDARDS

CE, UL, c-UL, C-Tick approvals.

Interview Compatibility

The L300P can communicate with DeviceNet[™]. PROFIBUS®, LONWORKS®, Modbus® RTU^{*1}, and Ethernet^{™*2} with communication options. *1, *2: Being planned

An optional conduit box is required for 37kW to 55kW to meet NEMA 1 . *2: The protection method conforms to JEM 1030 / NEMA(U.S.).

*3: The applicable motor refers to Hitachi standard 3-phase motor (4-pole). To use other motors, care must be taken to prevent the rated motor current (50Hz) from exceeding the rated output current of the inverter.

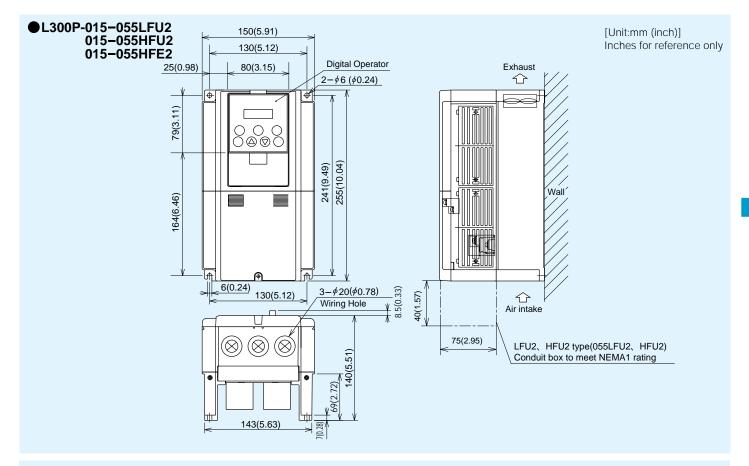

except for the use of AVR function.

*5: To operate the motor beyond 50/60Hz, please consult with the motor manufacturer about the maximum allowable rotation speed.

*8: Conforms to the test method specified in JIS C0040(1999).
*9: When using the inverter from 40° to 50°C ambient, the output current of the inverter must be derated (see the next section on derating curves).

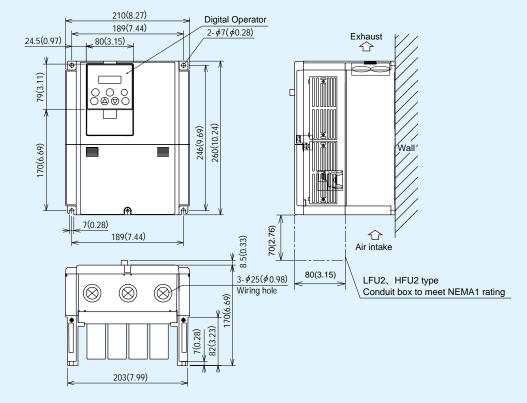

*6: Braking resistor is not integrated in the inverter. Please install optional braking resistor or dynamic braking unit when large braking torque is required.

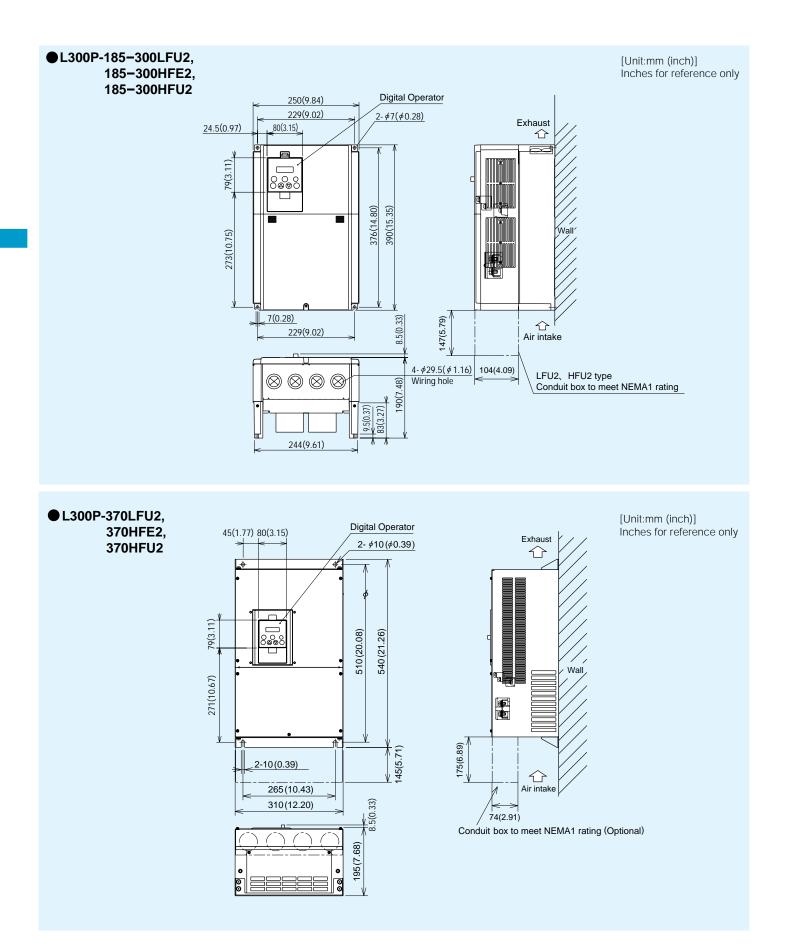

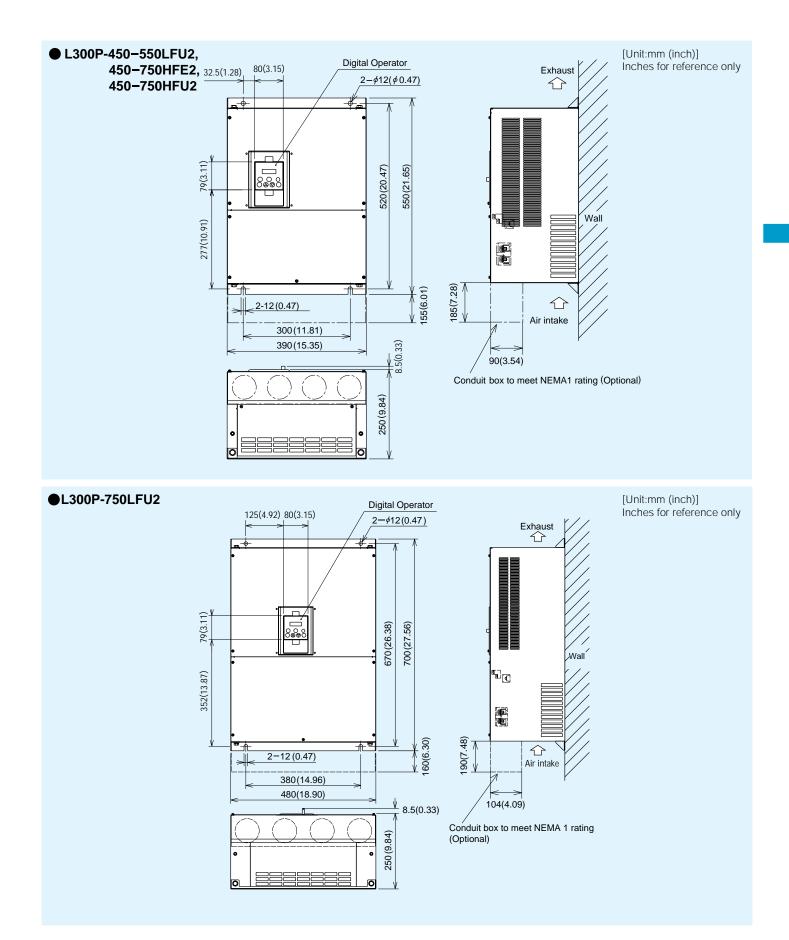

L300P-075-150LFU2, 075-150HFE2, 075-150HFU2

[Unit:mm (inch)] Inches for reference only

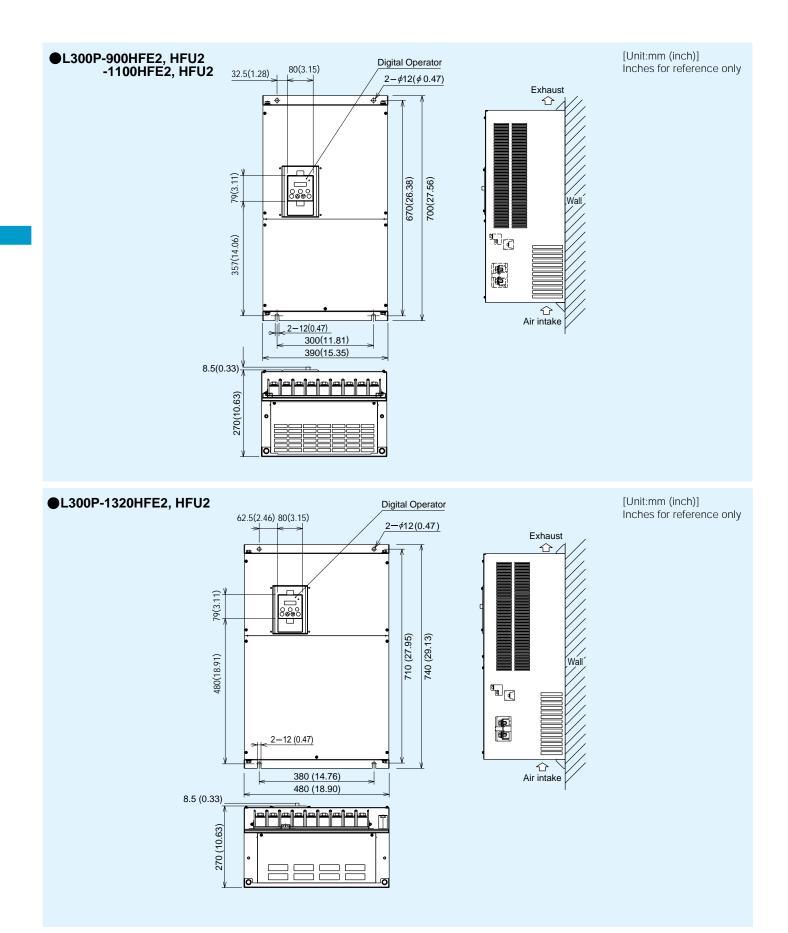

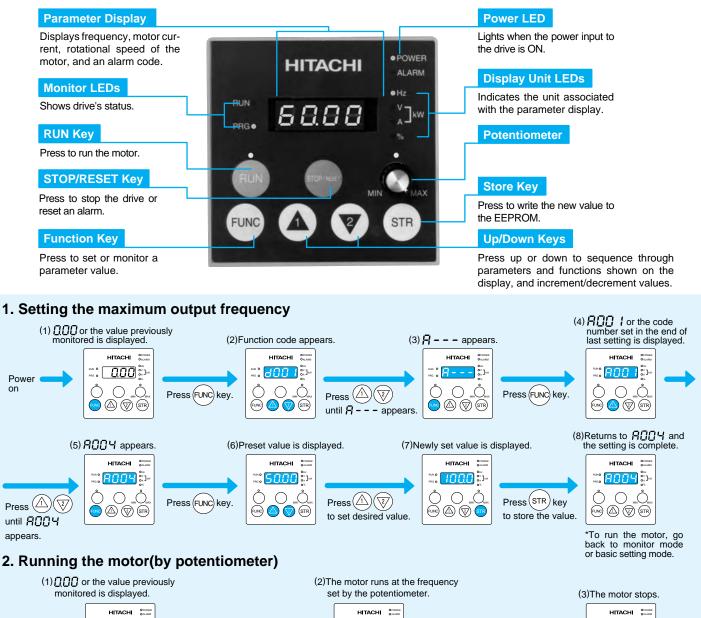

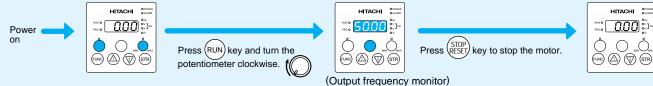

DIMENSIONS

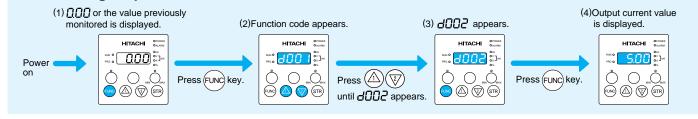

OPERATION and PROGRAMMING

L300P Series can be easily operated with the digital operator (OPE-SR) provided as standard. The Digital operator can also be detached and used for remote-control. A multilingual (English, French, German Italian, Spanish, and Portuguese) operator with copy function (SRW-0EX) or a digital operator without potentiometer(OPE-S) is also available as an option. (For US version, OPE-SRE (English overlay with potentiometer) is provided as standard.)

3. Monitoring output current value

Main Circuit Terminals

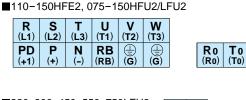

Terminal Description

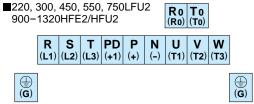

Terminal Symbol	Terminal Name
R(L1), S(L2), T(L3)	Main power supply input terminals
U(T1), V(T2), W(T3)	Inverter output terminals
PD(+1), P(+)	DC reactor connection terminals
P(+), RB(RB)	External braking resistor connection terminals
P(+), N(-)	External braking unit connection terminals
(G)	Ground connection terminal
R0(R0), T0(T0)	Control power supply input terminals

Terminal Arrangement

■015-055 LFU2, HFU2, HFE2

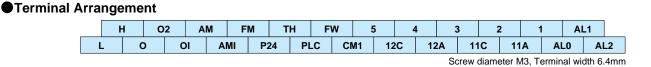

W:Terminal width

Screw Diameter and Terminal Width

	Main Circuit Terminals							R0,T0 Terminals			
	Model	015-037 LFU2 HFE2/HFU2	055LFU2 HFE2/HFU2		110-150LFU2 HFE2/HFU2	185LFU2,185-370 HFE2/HFU2	220-370LFU2, 450-750HFE2/HFU2	450-550 LFU2	750LFU2, 1320HFE2/HFU2	900-1100 HFE2/HFU2	All models

*For ground screw of 200, 300, 450, 550 LFU2, M6 is used. For 900-1320HFE/HFU2, M8 is used.

Control Circuit Terminals

Control Circuit Terminals

Terminal Description []: Default setting (CE/UL)

				: Default setting (CE/	52)	
			Symbol	Name	Explanation of Terminals	Ratings
	Power	Supply	L	Common Terminal for Analog Power Source	Common terminal for H, O, O2, OI, AM, and AMI. Do not ground.	_
	,		н	Power Source for Frequency Setting	Power supply for frequency command input	DC 10V, 20mA max.
		Frequency Setting		Frequency Command Terminal	Maximum frequency is attained at DC 10V in DC 0-10V range. Set the voltage at A014 to command maximum frequency below DC 10V.	Input impedance: $10k\Omega$, Allowable input voltage range: DC -0.3 - +12V
_	Frequenc			Frequency Command Extra Terminal	O2 signal is added to the frequency command of O or OI in DC $0-\pm10V$ range. By changing configuration, frequency command can be input also at O2 terminal.	Input impedance:10kΩ, Allowable input voltage range: DC 0-±12V
Analog				Frequency Command Terminal	Maximum frequency is attained at DC 20mA in DC 4-20mA range. When the intelligent terminal configured as AT is on, OI signal is enabled.	Input impedance: 100Ω, Allowable input voltage range: DC 0-24mA
	Monitor	Output	AM	Analog Output Monitor (Voltage)	Selection of one function from: Output frequency, output current, torque, output voltage, input	DC 0-10V, 2mA max.
	Wormor		AMI	Analog Output Monitor (Current)	power, electronic thermal load ratio, and LAD frequency.	DC 4-20mA, 250Ω max.
	Analog Sensor Input		тн	Thermistor Input Terminals	The inverter trips when the external thermistor detects abnormal temperature. Common terminal is CM1. [Recommended thermistor characteristics] Allowable rated power: 100mW or over. Impedance in the case of abnormal temperature: $3k\Omega$ Note: Thermal protection level can be set between 0 and 9999 Ω .	Allowable input voltage range
	Monitor Output		FM	Digital Monitor (Voltage)	[DC0-10V output (PWM output)] Selection of one function from: Output frequency, output current, torque, output voltage, input power, electronic thermal load ratio, and LAD frequency. [Digital pulse output (Pulse voltage DC 0/10V)] Outputs the value of output frequency as digital pulse (duty 50%)	Digital output frequency range: 0-3.6kHz, 1.2mA max.
	Power Supply		P24	Power Terminal for Interface	Internal power supply for input terminals. In the case of source type logic, common terminal for contact input terminals.	DC 24V, 100mA max.
			CM1	Common Terminal for Interface	Common terminal for P24, TH, and FM. In the case of sink type log- ic, common terminal for contact input terminals. Do not ground.	—
	Contact Input	Run Command		Forward Command Input	The motor runs forward when FW terminal is ON, and stops when FW is OFF.	[Input ON condition]
Digital		Functions	1 [RS/RS] 2 [AT/AT] 3 [CF2/USP] 4 [CF1/CF1] 5 [RV/RV]	Intelligent Input Terminals	Assign 5 functions to terminals. (Refer to the standard specifications for the functions.)	Voltage between each terminal and PLC: DC 18V min. [Input OFF condition] Voltage between each terminal and PLC: DC 3V max. Input impedance between each terminal and PLC: 4.7Ω
		Common Terminal	PLC	Common Terminal for Intelligent Input Terminals, Common Terminal for External Power Supply for PLCs, etc.	Select sink or source logic with the short-circuit bar on the control terminals. Sink logic: Short P24 to PLC / Source logic: Short CM1 to PLC. When applying external power source, remove the short-circuit bar and connect PLC terminal to the external device.	Allowable maximum voltage between each terminal and PLC: DC 27V
	Relay Output	State/ Alarm	12C [RUNRUN] 12A [RUNRUN] 11C [FA1/FA1] 11A [FA1/FA1] AL0 [AL/AL] AL1 [AL/AL] AL2 [AL/AL]	Intelligent Output Terminals	Assign 3 functions to two NO contacts and one NO-NC contact. (Refer to the standard specifications for the functions.) Intelligent relay output terminals	Maximum capacity of relays 11,12: AC 250V, 5A(R load)/1A(l load) DC 30V, 5A(R load)/1A(l load) AL1-AL0: AC 250V, 2A(R load)/0.2A(l load) DC 30V, 8A(R load)/0.2A(l load) AL2-AL0: AC 250V, 1A(R load)/0.2A(l load) DC 30V, 1A(R load)/0.2A(l load) DC 30V, 1A(R load)/0.2A(l load) Minimum capacity of relays 11,12: DC 1V, 1mA AL1-AL0, AL2-AL0: AC100V, 10mA DC5V, 100mA

PROTECTIVE FUNCTIONS

Name	Cause(s)		Display on digital operator	Display on remote operator/copy unit
	The inverter output was short-circuited, or the motor	While at constant speed	EO I	OC.Drive
Over-current	shaft is locked or has a heavy load.	During deceleration	503	OC.Drive
protection	These conditions cause excessive current for the inverter, so the inverter output is turned off.	During acceleration	<u>E03</u>	OC.Accel
		Others	<u>E04</u>	Over.C
Overload protection(*1)	When a motor overload is detected by the electronic to trips and turns off its output.	hermal function, the inverter	<u>E05</u>	Over.L
Braking resistor overload protection	When the regenerative braking resistor exceeds the usage time allowan stop of the BRD function is detected, the inverter trips and turns off its out		E06	OL.BRD
Over-voltage protection	When the DC bus voltage exceeds a threshold, due t the motor, the inverter trips and turns off its output.	to regenerative energy from	E07	Over.V
EEPROM error(*2)	When the built-in EEPROM memory has problems due to ature, the inverter trips and turns off its output.	o noise or excessive temper-	E08	EEPROM
Under-voltage error	A decrease of internal DC bus voltage below a threshold results in a cor also generate excessive motor heat or cause low torque. The inverter trips		<u>E09</u>	Under.V
CT(Current transformer) error	If a strong source of electrical interference is close to the inverter or abr in CT(Current transformer), the inverter trips and turns off its output.	normal operations occur in the built-	<u>E 10</u>	СТ
CPU error	When a malfunction in the built-in CPU has occurred, th its output.	EII	CPU1	
External trip	When a signal to an intelligent input terminal configure inverter trips and turns off its output.	<u>E 12</u>	EXTERNAL	
USP error	An error occurs when power is cycled while the inverter is in RUN mod (USP) is enabled. The inverter trips and does not go into RUN mode un	<u>E 13</u>	USP	
Ground fault	The inverter is protected by the detection of ground faults and the motor during power-up tests. This feature protect	<u>E 14</u>	GND.Flt.	
Input over-voltage protection	When the input voltage is higher than the specified valuater power-up and the inverter trips and turns of its out		<u>E 15</u>	OV.SRC
Instantaneous power failure	When power is cut for more than 15msec., the inverter trips and turns of ues, the error will be cleared. The inverter restarts if it is in RUN mode v	<u>E 16</u>	Inst.P-F	
Inverter thermal trip	When the inverter internal temperature is higher than the specified valu module detects the higher temperature of the power devices and trips, to		<u>E2 I</u>	OH FIN
Gate array error	Communication error has occured between CPU and g	ate array.	<u>E23</u>	GA
Missing phase	One of three lines of 3-phase power supply is missing.		EZH	PH.Fail
IGBT error	When instantaneous over-current has occurred, the in output to protect main circuit element.	verter trips and turns off its	<u>E 30</u>	IGBT
Thermistor error	When the thermistor inside the motor detects temperatuvalue, the inverter trips and turns off its output.	ure higher than the specified	<u>E35</u>	TH
Expansion card 1 connection error	An error has been detected in an expension cost or at its		<u> E60-E69</u>	OP1 0-9
Expansion card 2 connection error	An error has been detected in an expantion card or at its	connecting terminals.	<u>E-0-E-9</u>	OP2 0-9
Out of operation due to under-voltage	Due to insufficient voltage, the inverter has turned off its or restart. If it fails to restart, it goes into the under-voltage e		<u> </u>	UV.WAIT

(*1)You can clear the error by pressing the Start / Reset key 10 seconds after the trip occurred. (*2)If an EEPROM error **EDB** occurs, be sure to confirm the parameter data values are still correct.

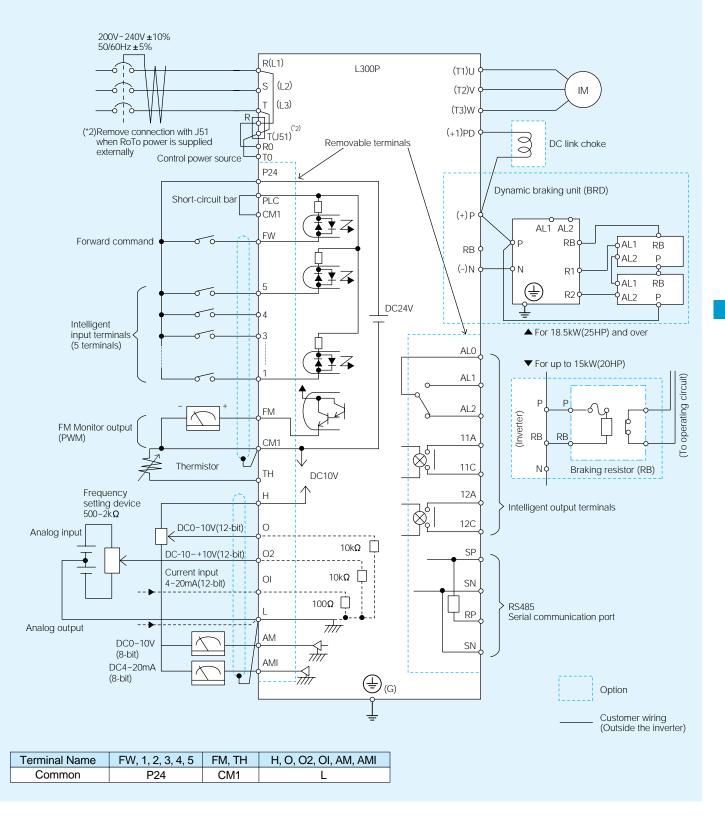

(How to access the details about the present fault)

CONNECTING DIAGRAM

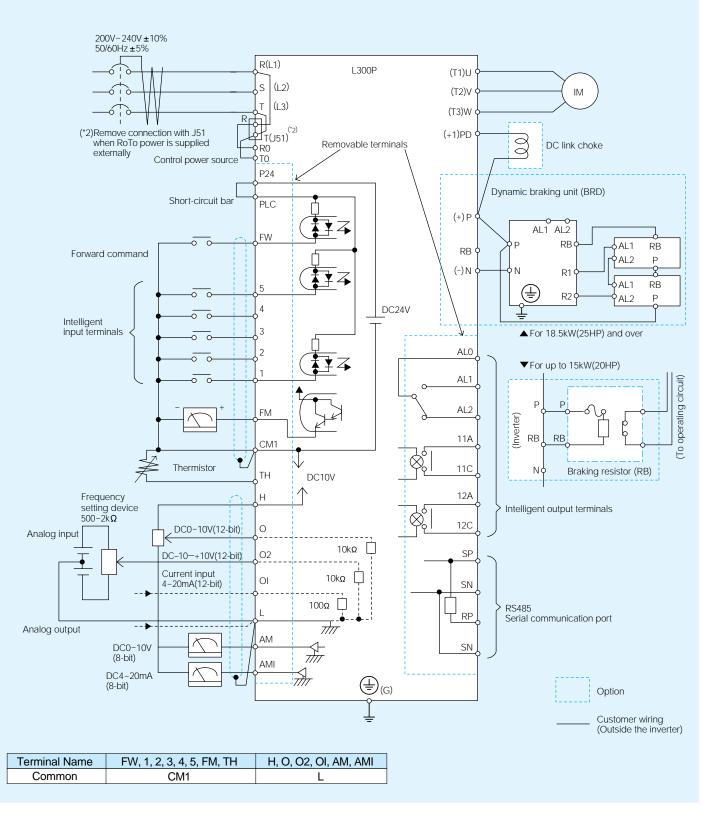

SOURCE TYPE LOGIC

In case of 400V class, place a transformer for operating circuit to receive 200V.

SINK TYPE LOGIC

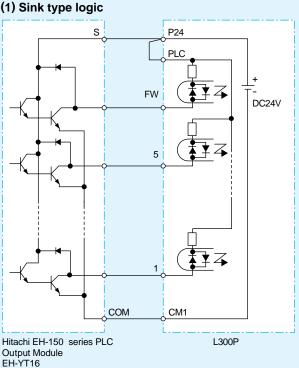

In case of 400V class, place a transformer for operating circuit to receive 200V.

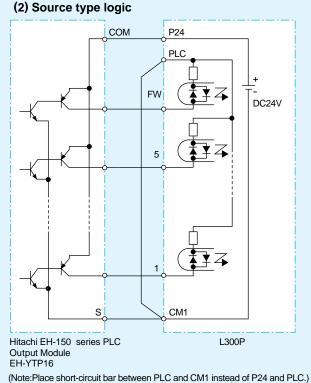

CONNECTING TO PLC

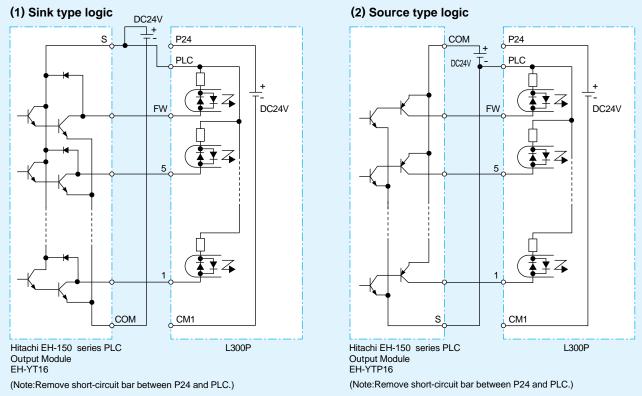

1. USING INTERNAL POWER SUPPLY OF THE INVERTER

2. USING EXTERNAL POWER SUPPLY

(Note:Be sure to turn on the inverter after turning on the PLC and its external power supply to prevent the parameters in the inverter from being modified.)

• Typical torque performance based on V/f pattern (top) is shown below.

DERATING DATA

The L300P series can be used at ambient temperature of -10° C to 50° C. However, when using at 40° C or over, derating is required.

FOR CORRECT OPERATION

Application to Motors

[Application to general-purpose motors]

Operating frequency	The overspeed endurance of a general-purpose motor is 120% of the rated speed for 2 minutes (JIS C4,004). For operation at higher than 60Hz, it is required to examine the allowable torque of the motor, useful life of bearings, noise, vibration, etc. In this case, be sure to consult the motor manufacturer as the maximum allowable rpm differs depending on the motor capacity, etc.
Torque characteristics	The torque characteristics of driving a general-purpose motor with an inverter differ from those of driving it using commer- cial power (starting torque decreases in particular). Carefully check the load torque characteristic of a connected machine and the driving torque characteristic of the motor.
Motor loss and temperature increase	An inverter-driven general-purpose motor heats up quickly at lower speeds. Consequently, the continuous torque level(output) will decrease at lower motor speeds. Carefully check the torque characteristics vs speed range requirements.
Noise	When run by an inverter, a general-purpose motor generates noise slightly greater than with commercial power.
Vibration	When run by an inverter at variable speeds, the motor may generate vibration, especially because of (a) unbalance of the rotor including a connected machine, or (b) resonance caused by the natural vibration frequency of a mechanical system. Particularly, be careful of (b) when operating at variable speeds a machine previously fitted with a constant speed motor. Vibration can be minimized by (1) avoiding resonance points using the frequency jump function of the inverter, (2) using a tire-shaped coupling, or (3) placing a rubber shock absorber beneath the motor base.
Power transmission mechanism	Under continued, low-speed operation, oil lubrication can deteriorate in a power transmission mechanism with an oil-type gear box (gear motor) or reducer. Check with the motor manufacturer for the permissible range of continuous speed. To operate at more than 60 Hz, confirm the machine's ability to withstand the centrifugal force generated.

[Application to special motors]

Gear motor	The allowable rotation range of continuous drive varies depending on the lubrication method or motor manufacturer. (Par- ticularly in case of oil lubrication, pay attention to the low frequency range.)
Brake-equipped motor	For use of a brake-equipped motor, be sure to connect the braking power supply from the primary side of the inverter.
Pole-change motor	There are different kinds of pole-change motors (constant output characteristic type, constant torque characteristic type, etc.), with different rated current values. In motor selection, check the maximum allowable current for each motor of a different pole count. At the time of pole changing, be sure to stop the motor.
Submersible motor	The rated current of a submersible motor is significantly larger than that of the general-purpose motor. In inverter selection, be sure to check the rated current of the motor. Also see: Application to the 400V-class motor.
Explosion-proof motor	Inverter drive is not suitable for a safety-enhanced explosion-proof type motor. The inverter should be used in combination with a pressure-proof explosion-proof type motor. *Explosion-proof verification is not available for L300P Series. For explosion-proof operation, use other series of motors.
Synchronous (MS) motor High-speed (HFM) motor	In most cases, the synchronous (MS) motor and the high-speed (HFM) motor are designed and manufactured to meet the specifications suitable for a connected machine. As to proper inverter selection, consult the manufacturer.
Single-phase motor	A single-phase motor is not suitable for variable-speed operation by an inverter drive. Therefore, use a three-phase motor.

[Application to the 400V-class motor]

A system applying a voltage-type PWM inverter with IGBT may have surge voltage at the motor terminals resulting from the cable constants including the cable length and the cable laying method. Depending on the surge current magnification, the motor coil insulation may be degraded. In particular, when a 400V-class motor is used, a longer cable is used, and critical loss can occur, take the following countermeasures:

(1) install the LCR filter between the inverter and the motor,

(2) install the AC reactor between the inverter and the motor, or

(3) enhance the insulation of the motor coil.

Notes on Use

[Drive]

Run/StopRun or stop of the inverter must be done with the keys on the operator panel or through the control circuit terminals. Do not operate by installing a electromagnetic contactor (Mg) in the main circuit.	
Emergency motor stop	When the protective function is operating or the power supply stops, the motor enters the free run stop state. When an emergency stop is required or when the motor should be kept stopped, use of a mechanical brake should be considered.
High-frequency operation	A max. 400Hz can be selected on the L300P Series. However, a two-pole motor can attain up to approx. 24,000 rpm, which is extremely dangerous. Therefore, carefully make selection and settings by checking the mechanical strength of the motor and connected machines. Consult the motor manufacturer when it is necessary to drive a standard (general-purpose) motor above 60 Hz.

[Installation location and operating environment]

Avoid installation in areas of high temperature, excessive humidity, or where moisture can easily collect, as well as areas that are dusty, subject to corrosive gasses, mist of liquid for grinding, or salt. Install the inverter away from direct sunlight in a well-ventilated room that is free of vibration. The inverter can be operated in the ambient temperature range from -10 to 50° C. (Carrier frequency and output current must be reduced in the range of 40 to 50° C.)

[Main power supply]

Installation of an AC reactor on the input side	In the following examples involving a general-purpose inverter, a large peak current flows on the main power supply side, and may destroy the converter module. Where such situations are foreseen or the connected equipment must be highly reli- able, install an AC reactor between the power supply and the inverter. Also, where influence of indirect lightning strike is pos- sible, install a lightning conductor. (A) The unbalance factor of the power supply is 3% or higher. (Note) (B) The power supply capacity is at least 10 times greater than the inverter capacity (the power supply capacity is 500 kVA or more). (C) Abrupt power supply changes are expected. Examples: (1) Several inverters are interconnected with a short bus. (2) A thyristor converter and an inverter are interconnected with a short bus. (3) An installed phase advance capacitor opens and closes. In cases (A), (B) and (C), it is recommended to install an AC reactor on the main power supply side. Note: Example calculation with Vks = 205V, Vst = 201V, Vtr = 200V Vrs : R-S line voltage, Vst : S-T line voltage, Vtr : T-R line voltage Unbalance factor of voltage = $\frac{Max. line voltage (min.) - Mean line voltage}{Mean line voltage} \times 100$ $= \frac{V_{RS} - (V_{RS} + V_{ST} + V_{TR})/3}{(V_{RS} + V_{ST} + V_{TR})/3} \times 100 = \frac{205 - 202}{202} \times 100 = 1.5$ (%)
Using a private power generator	An inverter run by a private power generator may overheat the generator or suffer from a deformed output voltage waveform of the generator. Generally, the generator capacity should be five times that of the inverter (kVA) in a PWM control system, or six times greater in a PAM control system.

Notes on Peripheral Equipment Selection

Wiring connections		 (1)Be sure to connect main power wires with R(L1), S(L2), and T(L3) (input) terminals and motor wires to U(T1), V(T2), and W(T3) terminals (output). (Incorrect connection will cause an immediate failure.) (2)Be sure to provide a grounding connection with the ground terminal (.). 		
Electro- magnetic contactor		When an electromagnetic contactor is installed between the inverter and the motor, do not perform on-off switching during running operation.		
Wiring between inverter and motor	Thermal relay	 When used with standard applicable output motors (Hitachi standard three-phase squirrel-cage four-pole motors), the L300P Series does not need a thermal relay for motor protection due to the internal electronic protective circuit. A thermal relay, however, should be used: during continuous running outside a range of 30 to 60 Hz. for motors exceeding the range of electronic thermal adjustment (rated current). when several motors are driven by the same inverter; install a thermal relay for each motor. The RC value of the thermal relay should be more than 1.1 times the rated current of the motor. Where the wiring length is 10 m or more, the thermal relay tends to turn off readily. In this case, provide an AC reactor on the output side or use a current sensor. 		
Installing a circuit breaker		Install a circuit breaker on the main power input side to protect inverter wiring and ensure personal safety. Choose an inverter-compatible circuit breaker. The conventional type may malfunction due to harmonics from the inverter. For more information, consult the circuit breaker manufacturer.		
Wiring distance		The wiring distance between the inverter and the remote operator panel should be 20 meters or less. When this distance is exceeded, use CVD-E (current-voltage converter) or RCD-E (remote control device). Shielded cable should be used on the wiring. Beware of voltage drops on main circuit wires. (A large voltage drop reduces torque.)		
Earth leakage relay		If the earth leakage relay (or earth leakage breaker) is used, it should have a sensitivity level of 15 mA or more (per inverter).		
Phase advance capacitor		Do not use a capacitor for power factor improvement between the inverter and the motor because the high-frequency components of the inverter output may overheat or damage the capacitor		

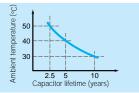

High-frequency Noise and Leakage Current

(1) High-frequency components are included in the input/output of the inverter main circuit, and they may cause interference in a transmitter, radio, or sensor if used near the inverter. The interference can be minimized by attaching noise filters (option) in the inverter circuitry. (2) The switching action of an inverter causes an increase in leakage current. Be sure to ground the inverter and the motor.

Lifetime of Primary Parts

Because a smoothing capacitor deteriorates as it undergoes internal chemical reaction, it should normally be replaced every five years. Be aware, however, that its life expectancy is considerably shorter when the inverter is subjected to such adverse factors as high temperatures or heavy loads exceeding the rated current of the inverter. The approximate lifetime of the capacitor is as shown in the figure at the right when it is used 12 hours daily (according to the "Instructions for Periodic Inspection of General-Purpose Inverter" (JEMĂ)).

Also, such moving parts (cooling fan) should be replaced. Maintenance inspection and parts replacement must be performed by only specified trained personnel.

Precaution for Correct Usage

- Before use, be sure to read through the Instruction Manual to insure proper use of the inverter.
- Note that the inverter requires electrical wiring; a trained specialist should carry out the wiring.
- The inverter in this catalog is designed for general industrial applications. For special applications in fields such as aircraft, outer space, nuclear power, electrical power, transport vehicles, clinics, and underwater equipment, please consult with us in advance.
- For application in a facility where human life is involved or serious losses may occur, make sure to provide safety devices to avoid a serious accident.
- The inverter is intended for use with a three-phase AC motor. For use with a load other than this, please consult with us.
