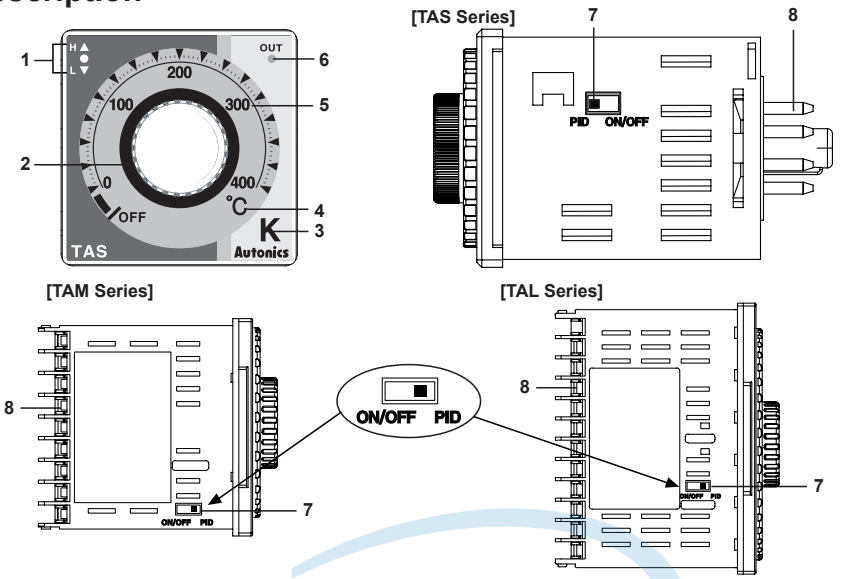
▣ Unit Description



1. Deviation indicator: It shows deviation of present temperature (PV) based on set temperature (SV) by LED.

PV deviation temperature	Input deviation indicator [Deviation indicator: ● (green), ▲/▼ (red)]
Input sensor OPEN	▲ + ● + ▼ indicators flash (every 0.5 sec)
Exceed max. input value	▲ indicator flashes (every 0.5 sec)
More than 10℃	▲ indicator turns ON
More than 2℃ to less than or equal to 10℃	▲ + ● indicators turn ON
Less than or equal to ±2℃	● indicator turns ON
More than -2℃ to less than or equal to -10℃	● + ▼ indicators turn ON
More than -10℃	▼ indicator turns ON
Less than min. input value	▼ indicator flashes (every 0.5 sec)

※This is the same as Fahrenheit (℉).

※When power is on, all indicators light for 2 sec, then they turn off and control operation starts.

2. Set temperature (SV) dial:

Dial to change set temperature (SV). When changing set temperature, it is applied after 2 sec for the stable input.

3. Input sensor type:

Indicates sensor type of present value. Input sensor type or input range each product is shown in the below table.

Input sensor		Range No.	Temperature range (℃)	Temperature range (℉)
Thermocouple	K (CA)	1	0 to 100	32 to 212

※Set temperature within input range each sensor.

4. Temperature unit: Indicates temperature unit (℃, ℉) of set temperature (SV) and present value (PV).

5. Temperature range: Indicates temperature range of set temperature (SV).

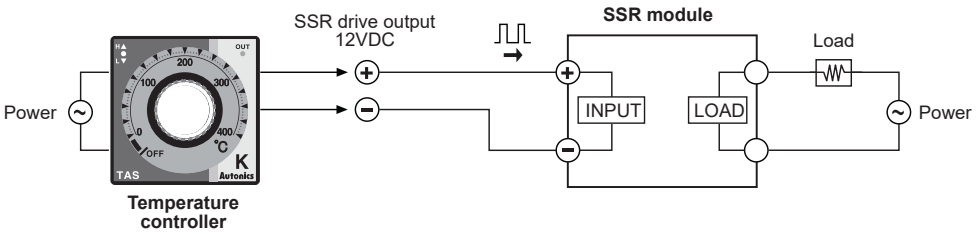
6. Control output indicator: Turns ON when control output (Relay output/SSR drive output).

7. Control mode selector switch: Select PID control (front part) or ON/OFF control (rear part) using switch.

8. Terminal: Terminals for external connections. For detail, refer to ▣ Connections.

▣ Functions

● SSR drive output

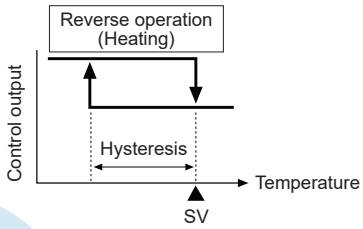


● ON/OFF control

ON/OFF control function is for controlling temperature by comparing present temperature (PV) to setting temperature (SV). ON/OFF control is fixed on reverse operation (Heating).

Output turns on to supply power to heater when present temperature (PV) falls lower than setting temperature (SV) and the output turns off to turn off heater when present temperature (PV) is higher then setting temperature (SV).

※Hysteresis is fixed 2℃ during ON/OFF control.



● PID control

PID constants are suggested and implemented based on self tuning from supply power until reaching set temperature (SV), then self tuning is over after reaching set temperature (SV).

When power supply, in case that set temperature (SV) dial points at OFF or self tuning can not be started because present temperature (PV) is higher than set temperature (SV) or hunting occurs during self tuning, output control is switched to proportion band (P) because that is considered to error. At that time, proportion band is fixed at 10℃.

※Control cycle of PID control and proportion control is 20 sec in relay output model and 2 sec in SSR drive output model.

● STOP

Control output could stop without power off by setting the front setting volume to below min. setting range.
If control output stops by STOP function, green indicator in deviation indicator (●) will flash every 1 sec.

● Error

Error mark will flash (every 1 sec) in PV indicator when error occurs during the control operation.
It will operate normally, if input sensor is connected or returned to normal range.

No	Display		Description
1	▲+●+▼	indicators flash	If input sensor line is broken or sensor is not connected.
2	▲	indicator flashes	If measured sensor input is higher than temperature range.
3	▼	indicator flashes	If measured sensor input is lower than temperature range.
